CLAIMS

1. An organic electroluminescent device comprising: a pair of positive and negative electrodes opposed to each other; and an organic functional layer formed between the positive and negative electrodes and having three or more thin films including a light emitting layer made of an organic compound, characterized in that the organic functional layer includes a pair of first and second layers and a third layer held between the first and second layers, each of the first and second layers being made of an organic compound a glass transition temperature of which is equal to or higher than a first temperature, the third layer being made of an organic compound a glass transition temperature of which is lower than the first temperature.

2. The organic electroluminescent device according to claim 1, wherein a difference between the glass transition temperature of the third layer and the glass transition temperature of the first or second layer is equal to or more than 12 ℃.

3. The organic electroluminescent device according to claim 1 or 2, wherein the first temperature is 107 ℃.

4. The organic electroluminescent device according to claim 1, wherein the organic compound included in the third layer shows photoluminescence, and a peak thereof is equal to or less than 500 nm.
